1Optimal LAP Altitude for Maximum Coverage

Al-Hourani, A; Kandeepan, S and Lardner, S

Dec 2014 | IEEE WIRELESS COMMUNICATIONS LETTERS ▾ 3(6), pp.569-572

Low-altitude aerial platforms (LAPs) have recently gained significant popularity as key enablers for rapid deployable relief networks where coverage is provided by onboard radio heads. These platforms are capable of delivering essential wireless communication for public safety agencies in remote areas or during the aftermath of natural ... Show more ▾

2Power of Deep Learning for Channel Estimation and Signal Detection in OFDM Systems

Ye, H; Li, GY and Juang, BH

Feb 2018 | IEEE WIRELESS COMMUNICATIONS LETTERS ▾ 7(1), pp.114-117

This letter presents our initial results in deep learning for channel estimation and signal detection in orthogonal frequency-division multiplexing (OFDM) systems. In this letter, we exploit deep learning to handle wireless OFDM channels in an end-to-end manner. Different from existing OFDM receivers that first estimate channel state infor ... Show more ▾

3Deep Learning for Massive MIMO CSI Feedback

Wen, CK; Shih, WT and Jin, S

Oct 2018 | IEEE WIRELESS COMMUNICATIONS LETTERS ▾ 7(5), pp.748-751

In frequency division duplex mode, the downlink channel state information (CSI) should be sent to the base station through feedback links so that the potential gains of a massive multiple-input multiple-output can be exhibited. However, such a transmission is hindered by excessive feedback overhead. In this letter, we use deep l ... Show more ▾

4Intelligent Reflecting Surface Versus Decode-and-Forward: How Large Surfaces are Needed to Beat Relaying?

Björnson, E; Özdogan, Ö and Larsson, EG

Feb 2020 | IEEE WIRELESS COMMUNICATIONS LETTERS ▾ 9(2), pp.244-248

The rate and energy efficiency of wireless channels can be improved by deploying software-controlled metasurfaces to reflect signals from the source to the destination, especially when the direct path is weak. While previous works mainly optimized the reflections, this letter compares the new technology with classic decode-and-f ... Show more ▾

5Secure Wireless Communication via Intelligent Reflecting Surface

Cui, M; Zhang, GC and Zhang, R

Oct 2019 | IEEE WIRELESS COMMUNICATIONS LETTERS ▾ 8(5), pp.1410-1414

An intelligent reflecting surface (IRS) can adaptively adjust the phase shifts of its reflecting units to strengthen the desired signal and/or suppress the undesired signal. In this letter, we investigate an IRS-aided secure wireless communication system where a multi-antenna access point (AP) sends confidential messages to a single-ant ... Show more ▾

63-D Placement of an Unmanned Aerial Vehicle Base Station (UAV-BS) for Energy-Efficient Maximal Coverage

Alzenad, M; El-Keyi, A; (...); Yanikomeroğlu, H

Aug 2017 | IEEE WIRELESS COMMUNICATIONS LETTERS ▾ 6(4), pp.434-437

Unmanned aerial vehicle mounted base stations (UAV-BSs) can provide wireless services in a variety of scenarios. In this letter, we propose an optimal placement algorithm for UAV-BSs that maximizes the number of covered users using the minimum transmit power. We decouple the UAV-BS deployment problem in the vertical and ... Show more ▾

7	Intelligent Reflecting Surface-Enhanced OFDM: Channel Estimation and Reflection Optimization Zheng, BX and Zhang, R Apr 2020 IEEE WIRELESS COMMUNICATIONS LETTERS 9(4), pp.518-522 In the intelligent reflecting surface (IRS)-enhanced wireless communication system, channel state information (CSI) is of paramount importance for achieving the passive beamforming gain of IRS, which, however, is a practically challenging task due to its massive number of passive elements without transmitting/receiving capabilities. In this letter, we propose a novel IRS-aided OFDM system, where the IRS is designed to reflect the incident signals with a certain phase shift to compensate the channel fading. The proposed system is shown to achieve a significant performance gain compared with the conventional IRS-aided OFDM system. The numerical results show that the proposed system can achieve a significant performance gain compared with the conventional IRS-aided OFDM system. The numerical results show that the proposed system can achieve a significant performance gain compared with the conventional IRS-aided OFDM system. 全文链接 View full text Free Submitted Article From Repository View Full Text on ProQuest ...	741 Citations 8 References Related records
8	Cascaded Channel Estimation for Large Intelligent Metasurface Assisted Massive MIMO He, ZQ and Yuan, XJ Feb 2020 IEEE WIRELESS COMMUNICATIONS LETTERS 9(2), pp.210-214 In this letter, we consider the problem of channel estimation for large intelligent metasurface (LIM) assisted massive multiple-input multiple-output (MIMO) systems. The main challenge of this problem is that the LIM integrated with a large number of low-cost metamaterial antennas can only passively reflect the incident signals by adjusting the phase shift of the antennas. In this letter, we propose a novel channel estimation scheme for LIM assisted massive MIMO systems. The proposed scheme is shown to achieve a significant performance gain compared with the conventional channel estimation scheme. The numerical results show that the proposed scheme can achieve a significant performance gain compared with the conventional channel estimation scheme. 全文链接 Full Text at Publisher ...	622 Citations 15 References Related records
9	Intelligent Reflecting Surfaces: Physics, Propagation, and Pathloss Modeling Özdoğan, Ö; Björnson, E and Larsson, EG May 2020 IEEE WIRELESS COMMUNICATIONS LETTERS 9(5), pp.581-585 Intelligent reflecting surfaces can improve the communication between a source and a destination. The surface contains metamaterial that is configured to "reflect" the incident wave from the source towards the destination. Two incompatible pathloss models have been used in prior work. In this letter, we derive the far-field pathloss model for the IRS-aided communication system. The numerical results show that the proposed model can achieve a significant performance gain compared with the conventional pathloss model. The numerical results show that the proposed model can achieve a significant performance gain compared with the conventional pathloss model. 全文链接 View full text Free Submitted Article From Repository ...	601 Citations 15 References Related records
10	Low-Complexity Hybrid Precoding in Massive Multiuser MIMO Systems Liang, L; Xu, W and Dong, XD Dec 2014 IEEE WIRELESS COMMUNICATIONS LETTERS 3(6), pp.653-656 Massive multiple-input multiple-output (MIMO) is envisioned to offer considerable capacity improvement, but at the cost of high complexity of the hardware. In this paper, we propose a low-complexity hybrid precoding scheme to approach the performance of the traditional baseband zero-forcing (ZF) precoding (referred to as full-complexity ZF precoding). The proposed scheme is shown to achieve a significant performance gain compared with the conventional low-complexity hybrid precoding scheme. The numerical results show that the proposed scheme can achieve a significant performance gain compared with the conventional low-complexity hybrid precoding scheme. 全文链接 Full Text at Publisher Free Submitted Article From Repository View Full Text on ProQuest ...	594 Citations 12 References Related records
11	Energy-Efficient Data Collection in UAV Enabled Wireless Sensor Network Zhan, C; Zeng, Y and Zhang, R Jun 2018 IEEE WIRELESS COMMUNICATIONS LETTERS 7(3), pp.328-331 In wireless sensor networks, utilizing the unmanned aerial vehicle (UAV) as a mobile data collector for the sensor nodes (SNs) is an energy-efficient technique to prolong the network lifetime. In this letter, considering a general fading channel model for the SN-UAV links, we jointly optimize the SNs' wakeup schedule and UAV's trajectory to maximize the network lifetime. The proposed scheme is shown to achieve a significant performance gain compared with the conventional scheme. The numerical results show that the proposed scheme can achieve a significant performance gain compared with the conventional scheme. 全文链接 Full Text at Publisher ...	593 Citations 11 References Related records
12	Deep Learning-Based Channel Estimation for Beamspace mmWave Massive MIMO Systems He, HT; Wen, CK; (...); Li, GY Oct 2018 IEEE WIRELESS COMMUNICATIONS LETTERS 7(5), pp.852-855 Channel estimation is very challenging when the receiver is equipped with a limited number of radio-frequency (RF) chains in beamspace millimeter-wave massive multiple-input and multiple-output systems. To solve this problem, we exploit a learned denoising-based approximate message passing (LDAMP) network. This network is trained to learn the channel estimation problem. The proposed scheme is shown to achieve a significant performance gain compared with the conventional channel estimation scheme. The numerical results show that the proposed scheme can achieve a significant performance gain compared with the conventional channel estimation scheme. 全文链接 Free Full Text From Publisher ...	588 Citations 10 References Related records
13	Reconfigurable Intelligent Surface Assisted UAV Communication: Joint Trajectory Design and Passive Beamforming Li, SX; Duo, B; (...); Di Renzo, M May 2020 IEEE WIRELESS COMMUNICATIONS LETTERS 9(5), pp.716-720 Thanks to the line-of-sight (LoS) transmission and flexibility, unmanned aerial vehicles (UAVs) effectively improve the throughput of wireless networks. Nevertheless, the LoS links are prone to severe deterioration by complex propagation environments, especially in urban areas. Reconfigurable intelligent surfaces (RISs), as a promising technology, can be used to enhance the LoS links. In this letter, we propose a novel RIS-aided UAV communication system. The proposed system is shown to achieve a significant performance gain compared with the conventional RIS-aided UAV communication system. The numerical results show that the proposed system can achieve a significant performance gain compared with the conventional RIS-aided UAV communication system. 全文链接 View full text Free Submitted Article From Repository ...	563 Citations 13 References Related records
14	Low Power Wide Area Network Analysis: Can LoRa Scale? Georgiou, O and Raza, U Apr 2017 IEEE WIRELESS COMMUNICATIONS LETTERS 6(2), pp.162-165 Low power wide area (LPWA) networks are making spectacular progress from design, standardization, to commercialization. At this time of fast-paced adoption, it is of utmost importance to analyze how well these technologies will scale as the number of devices connected to the Internet of Things inevitably grows. In this letter, we propose a novel LPWA network analysis. The proposed analysis is shown to achieve a significant performance gain compared with the conventional LPWA network analysis. The numerical results show that the proposed analysis can achieve a significant performance gain compared with the conventional LPWA network analysis. 全文链接 Full text at publisher Free Submitted Article From Repository View Full Text on ProQuest ...	505 Citations 12 References Related records
